# Kinematics in One Dimension

“Life is in infinite motion; at the same time it is motionless.”

— Debasish Mridha

---

---

# Mechanics

---

- ❖ The study of motion
- ❖ *Kinematics*
  - ❖ Description of *how* things move
- ❖ *Dynamics*
  - ❖ Description of *why* things move

---

# Reference Frames

---

- ❖ What does it mean to be motionless?
- ❖ Sitting there in your seat, you're not moving, right?
- ❖ BUT! the Earth is rotating about its axis at **1,500 km/h**
- ❖ and orbiting around the Sun at **107,000 km/h**
- ❖ which itself orbiting around the supermassive blackhole at the center of the galaxy at **792,000 km/h**
- ❖ in an ever-expanding Universe (another **2.1 million km/h!**)

---

# It's All Relative

---

- ❖ A train zips past a train station at 80 km/h
- ❖ While standing on the train, you throw a baseball at 20 km/h
- ❖ From the reference frame of you and the train, the ball leaves you at 20 km/h
- ❖ But from the reference frame of your friend at the train station, the ball is moving at  $80 \text{ km/h} + 20 \text{ km/h} = 100 \text{ km/h}$ !
- ❖ Both are equally valid observations of the baseball, it all just depends on the reference frame you pick

---

# It's All Relative

---

- ❖ Likewise, there's no point in me telling you "Disneyland is 40 km away" unless I specify 40 km away *from where*
- ❖ Also, 40 km *in what direction?*

---

# Lab Frame

---

- ❖ Often in science, we implicitly choose the reference frame to be what we call the *lab frame*
- ❖ For our purposes, that will mean relative to this room we are sitting in right now
- ❖ Good to get comfortable with changing between reference frames

---

# Distance vs. Displacement

---

- ❖ Little Sally leaves her home, walks **40 m north**

---

# Distance vs. Displacement

---

- ❖ Little Sally leaves her home, walks 40 m north, 30 m east

---

# Distance vs. Displacement

---

- ❖ Little Sally leaves her home, walks 40 m north, 30 m east, and **20 m south**

---

# Distance vs. Displacement

---

- ❖ Little Sally leaves her home, walks 40 m north, 30 m east, and 20 m south
- ❖ How far did Little Sally travel?
- ❖  $40\text{ m} + 30\text{ m} + 20\text{ m} = \boxed{90\text{ m}}$
- ❖ This is the *distance* she traveled

# Distance vs. Displacement

- ❖ Little Sally leaves her home, walks 40 m north, 30 m east, and 20 m south
- ❖ How far is Sally from home?
- ❖  $\sqrt{(20^2 + 30^2)} = 36 \text{ m}$
- ❖ In what direction?
- ❖  $\tan^{-1}(20/30) = 34^\circ \text{ North of East}$
- ❖ **36 m @ 34° N of E**
- ❖ This is Sally's *displacement*

---

# Scalars vs. Vectors

---

- ❖ **Scalars** only includes magnitude
  - ❖ E.g. distance is a scalar quantity
- ❖ **Vectors** include both magnitude and direction
  - ❖ E.g. displacement is a vector quantity

---

# Speed vs. Velocity

---

- ❖ Both refer to how fast an object is moving
- ❖ *Average speed*
  - ❖ distance traveled divided by the time it takes to travel this distance
  - ❖ average speed =  $\frac{\text{distance traveled}}{\text{time elapsed}}$

---

# Speed vs. Velocity

---

- ❖ **Velocity** signifies both the *magnitude* of how fast an object is moving and the *direction* in which it is moving
- ❖ *Average velocity*
  - ❖ total displacement divided by time
  - ❖ average velocity =  $\frac{\text{displacement}}{\text{time elapsed}}$

---

# Speed vs. Velocity

---

- ❖ Let's say it took Little Sally 70 s to complete her journey

---

# Speed vs. Velocity

---

- ❖ Let's say it took Little Sally 70 s to complete her journey
- ❖ average speed =  $\frac{\text{distance}}{\text{time}}$

---

# Speed vs. Velocity

---

- ❖ Let's say it took Little Sally 70 s to complete her journey
- ❖ average speed =  $\frac{\text{distance}}{\text{time}} = \frac{90 \text{ m}}{70 \text{ s}}$

---

# Speed vs. Velocity

---

- ❖ Let's say it took Little Sally 70 s to complete her journey
- ❖ average speed =  $\frac{\text{distance}}{\text{time}} = \frac{90 \text{ m}}{70 \text{ s}} = 1.3 \text{ m/s}$

---

# Speed vs. Velocity

---

- ❖ Let's say it took Little Sally 70 s to complete her journey
- ❖ average speed =  $\frac{\text{distance}}{\text{time}} = \frac{90 \text{ m}}{70 \text{ s}} = 1.3 \text{ m/s}$
- ❖ average velocity =  $\frac{\text{displacement}}{\text{time}}$

---

# Speed vs. Velocity

---

- ❖ Let's say it took Little Sally 70 s to complete her journey
- ❖ average speed =  $\frac{\text{distance}}{\text{time}} = \frac{90 \text{ m}}{70 \text{ s}} = 1.3 \text{ m/s}$
- ❖ average velocity =  $\frac{\text{displacement}}{\text{time}} = \frac{36 \text{ m}}{70 \text{ s}}$

---

# Speed vs. Velocity

---

- ❖ Let's say it took Little Sally 70 s to complete her journey
- ❖ average speed =  $\frac{\text{distance}}{\text{time}} = \frac{90 \text{ m}}{70 \text{ s}} = 1.3 \text{ m/s}$
- ❖ average velocity =  $\frac{\text{displacement}}{\text{time}} = \frac{36 \text{ m}}{70 \text{ s}} = 0.51 \text{ m/s}$

---

# First Equation of the Year!

---

$$\diamond v = \frac{\Delta x}{\Delta t}$$

# Example Number 1

- ❖ Sonic, the world's fastest hedgehog™, is escaping from the city
- ❖ During a 3.00 s time interval, Sonic moves from being 30.0 m away from the city to 1,060 m away
- ❖ What is Sonic's average velocity?
- ❖ *Ans. 343 m/s*

---

# Example Number 2

---

- ❖ Miles “Tails” Prower flies towards the city to try to find Sonic
- ❖ During a 5.00 s interval, Tails moves from being 2,540 m away from the city to being 2,330 m away
- ❖ What is Tails’ average velocity?
- ❖ *Ans. -42.0 m/s*

---

# Ejemplo Numero 3

---

- ❖ Geralt of Rivia rides atop his stallion at 48 km/h for 2.5 h
- ❖ How far has he travelled in that time?
- ❖ *Ans. 120 km*

---

# Instantaneous Velocity

---

- ❖ You are in a car heading downtown, as you can see from the speedometer your speed is 40 mi/h.
- ❖ Downtown is 10 miles away at this speed, how long will it take you?
- ❖ IS THIS TRUE???

---

# Average Velocity

---

- ❖ It would take us a lot longer than 15 minutes to drive downtown because of the traffic where we have to slow, stop, start, accelerate, slow, stop, etc., etc.,.

---

# Acceleration

---

- ❖ Going in a straight line at the same speed is called **Constant Velocity**.
- ❖ But if we change our speed (brake at a light) or our direction (turn a corner) then we have a **Changing Velocity**
- ❖ Changing our speed or direction is **Acceleration**

---

# Acceleration

---

- ❖ *Acceleration* is how quickly velocity changes
- ❖  $a = \frac{\Delta v}{\Delta t}$
- ❖ When we accelerate in a car from rest to 75 km/h in 5 s
- ❖  $a = (75 \text{ km/h} - 0 \text{ km/h}) / (5 \text{ s})$   
 $= 15 \text{ km/h/s}$

---

# Acceleration

---

- ❖ To convert to SI units, change km/h over to m/s
- ❖  $75 \text{ km/h} = 21 \text{ m/s}$
- ❖  $a = (21 \text{ m/s} - 0 \text{ m/s}) / (5 \text{ s})$   
 $= 4.2 \text{ m/s}^2$

---

# Example 4

---

- ❖ Brian O'Connor is driving at 54 m/s before deciding he is driving *way* too fast and a little too furiously
- ❖ He slows the car to a reasonable 35 m/s in 5.0 s
- ❖ What is O'Connor's average acceleration?
- ❖ *Ans.  $-3.8 \text{ m/s}^2$*

---

# Acceleration

---

- ❖ Acceleration also applies to changes in direction.
- ❖ We feel the effects when in a car we are pushed to the side when we turn a sharp corner

---

# Sanity Check

---

- ❖ If the instantaneous velocity of an object is zero, does it mean that the instantaneous acceleration is zero?
- ❖ If the instantaneous acceleration is zero, does it mean that the instantaneous velocity is zero?
  - ❖ Answer: *not necessarily*
- ❖ Can you think of examples?

---

# Motion at Constant Acceleration

---

- ❖ If acceleration is constant (which in many practical situations it is), then average and instantaneous acceleration are the same
- ❖ Can use this fact to derive some pretty convenient relationships between acceleration, velocity, and position with respect to time

---

# Motion at Constant Acceleration

---

$$\diamond a = \frac{\Delta v}{\Delta t} = \frac{v_f - v_i}{\Delta t}$$

$$\longrightarrow v_f = v_i + a\Delta t$$

$$\diamond v = \frac{\Delta x}{\Delta t} = \frac{x_f - x_i}{\Delta t}$$

$$\longrightarrow x_f = x_i + v\Delta t$$

---

# Motion at Constant Acceleration

---

- ❖ With a little simple calculus, can find acceleration's contribution to a change in position
- ❖  $x_f = x_i + v_i \Delta t + \frac{1}{2} a \Delta t^2$
- ❖  $v_f^2 = v_i^2 + 2a \Delta x$
- ❖ (For the full derivation check out <http://physics.info/kinematics-calculus/>; for an algebraic justification, read Giancoli pg.27)

---

# Kinematic Equations

---

- ❖  $v_f = v_i + a\Delta t$
- ❖  $x_f = x_i + v_i\Delta t + \frac{1}{2} a\Delta t^2$
- ❖  $v_f^2 = v_i^2 + 2a\Delta x$
- ❖ **Important note:** these equations are only valid under *constant* acceleration

---

# Example 5

---

- ❖ You are designing an airport for small planes. One kind of airplane that might use this airfield must reach a speed before takeoff of at least  $27.8 \text{ m/s}$  ( $100 \text{ km/h}$ ) and can accelerate at  $2.00 \text{ m/s}^2$ . If the runway is  $150 \text{ m}$  long, can this plane speed to take off?
- ❖ *Ans. No*
- ❖ What minimum length must the runway have?
- ❖ *Ans. 193 m*

---

# Example 6

---

- ❖ How long does it take a car to cross a 30.0-m-wide intersection after the light turns green if it accelerates from rest at a constant  $2.00 \text{ m/s}^2$ ?
- ❖ *Ans. 5.48 s*

---

# Example 7

---

- ❖ Minimum stopping distance is important in traffic design. The average human reaction time is 0.22 s, meaning there is a 0.22 s delay between when one decides to break and when he or she actually begins breaking. A typical car can decelerate at  $6.0 \text{ m/s}^2$  in good conditions. Knowing this, calculate the total stopping distance in meters for a vehicle is traveling at 100. km/h.
- ❖ *Ans. 71 m*

---

# Example 8

---

- ❖ A baseball pitcher throws a fastball with a speed of 44 m/s. If the pitcher accelerates the ball through a displacement of about 3.5 m before releasing it, estimate the average acceleration of the ball during the throwing motion.
- ❖ *Ans. 280 m/s<sup>2</sup>*

---

# Example 9

---

- ❖ You want to design an air-bag system that can protect the driver in a head-on collision at a speed of 100 km/h. If the car crumples upon impact over a distance of about 1 m, how fast must the air bag inflate to effectively protect the driver?
- ❖ *Ans. less than 0.07 s*

---

# Freefall

---

- ❖ All object accelerate towards the Earth under the force of gravity
- ❖ *Accelerate* — so they will pick up speed as they descend

---

# Freefall

---

- ❖ Up through the 16th Century, most people's intuition about freefall centered around the teachings of Aristotle
  - ❖ “bodies of different weight [...] move in one and the same medium with different speeds which stand to one another in the same ratio as the weights; so that, for example, a body which is ten times as heavy as another will move ten times as rapidly as the other.”

---

# Freefall

---

- ❖ Galileo Galilei was the first scientific mind to challenge this commonly held belief
- ❖ Dropped masses off the edge of the Leaning Tower of Pisa

---

# Freefall

---

- ❖ Acceleration due to gravity acts on all objects the same regardless of their mass
- ❖ Any observed differences are on account of air resistance

<https://www.youtube.com/watch?v=E43-CfukEgs>

---

# Freefall

---

- ❖ How fast, exactly, does gravity accelerate objects here on Earth?
- ❖ Actual value:
  - ❖  $g = 9.81 \text{ m/s}^2$
- ❖ Only the acceleration due to gravity here on Earth
- ❖ Varies slightly depending on latitude and elevation

# Example 10

- ❖ Saruman is conducting physics experiments from atop the Tower of Orthanc.
- ❖ If he drops a ball from the peak of his 150-m-tall fortress, how far will the ball have fallen after 1.00 s, 2.00 s, and 3.00 s? (Neglect air resistance)
- ❖ *Ans. 4.90 m*
- ❖ *19.6 m*
- ❖ *44.1 m*

---

# Example 11

---

- ❖ Wishing to take things a step further, the White Wizard instead *throws* the ball downward with an initial velocity of  $3.00 \text{ m/s}$ .
- ❖ What would be the ball's position and speed after  $1.00 \text{ s}$  and  $2.00 \text{ s}$ ?
- ❖ *Ans @  $1.00 \text{ s}$ :  $7.90 \text{ m}$ ,  $12.8 \text{ m/s}$*
- ❖ *@  $2.00 \text{ s}$ :  $25.6 \text{ m}$ ,  $22.6 \text{ m/s}$*

# Example 12

- ❖ Feeling ambitious, Saruman now throws the ball *upward* at  $3.00 \text{ m/s}$ .
- ❖ How high does the ball go?
- ❖ How long is the ball in the air before it comes back to his hand?
- ❖ What is the ball's velocity when it comes back to his hand?
- ❖ *Ans.  $0.458 \text{ m}$*
- ❖  *$0.612 \text{ s}$*
- ❖  *$-3.00 \text{ m/s}$*
